

Angular UI — Source Label Changes

Source Mapping (Old → New)

Page	Old Source Label	New Source Label	Gold Table
App Health	Aternity	Netscout App · ElastiFlow	app_health_summary
Device Health	Intune	DXNETOPS	device_health_summary
Network Performance	NetScout · Infoblox	ElastiFlow · Netscout Throughput	network_performance_summary
Top Issues	ScienceLogic	NETCOOL	top_issues_summary
Version Sprawl	Intune	DataNX	version_sprawl_summary
Data Sources	all old	NETCOOL · DXNETOPS · ElastiFlow · Netscout App · Netscout Throughput · DataNX	data_source_ingestion_status

1. Sidebar Navigation

File: `app.component.ts` or `nav.component.ts` (wherever the sidebar links are)

Look for the nav items array and change the subtitle/badge labels:

```
typescript
```

```
// BEFORE
{ label: 'App Health',    sub: 'Aternity',    ... }
{ label: 'Device Health', sub: 'Intune',      ... }
{ label: 'Network ...',  sub: 'NetScout',    ... }
{ label: 'Top Issues',   sub: 'ScienceLogic', ... }
{ label: 'Version Sprawl',sub: 'Intune',      ... }

// AFTER
{ label: 'App Health',    sub: 'Netscout App', ... }
{ label: 'Device Health', sub: 'DXNETOPS',    ... }
{ label: 'Network ...',  sub: 'ElastiFlow',    ... }
{ label: 'Top Issues',   sub: 'NETCOOL',       ... }
{ label: 'Version Sprawl',sub: 'DataNX',       ... }
```

2. Overview / Dashboard Page

File: `overview.component.ts` or `dashboard.component.ts`

```
html

<!-- BEFORE -->
<p>Operations Engineering – Real-time intelligence from
  Aternity · NetScout · Intune · Infoblox · Salesforce · ScienceLogic</p>

<!-- AFTER -->
<p>Operations Engineering – Real-time intelligence from
  NETCOOL · DXNETOPS · ElastiFlow ·
  Netscout App · Netscout Throughput · DataNX</p>
```

Also update the source cards/tiles on the overview if they list individual systems.

3. app-health.component.ts

```
html
```

```
<!-- BEFORE -->
<p class="source-note">Source: <strong>Aternity</strong> –
  End User Experience Monitoring</p>

<!-- AFTER -->
<p class="source-note">
  Sources:
    <strong>Netscout App</strong> (application performance) ·
    <strong>ElastiFlow</strong> (network flows)
</p>
```

4. device-health.component.ts

```
html

<!-- BEFORE -->
<p class="source-note">Source: <strong>Intune</strong> – Device Management</p>

<!-- AFTER -->
<p class="source-note">
  Source: <strong>DXNETOPS</strong> – Device CPU, Memory & Performance Metrics
</p>
```

5. network-performance.component.ts

```
html

<!-- BEFORE -->
<p class="source-note">
  Sources: <strong>NetScout</strong> (network monitoring) ·
    <strong>Infoblox</strong> (DNS/DHCP/IPAM)</p>

<!-- AFTER -->
<p class="source-note">
  Sources:
    <strong>ElastiFlow</strong> (IPFIX network flows) ·
    <strong>Netscout Throughput</strong> (bandwidth monitoring)
</p>
```

6. top-issues.component.ts

```
html

<!-- BEFORE -->
<p class="source-note">Source: <strong>ScienceLogic</strong> – AIOps</p>

<!-- AFTER -->
<p class="source-note">
  Source: <strong>NETCOOL</strong> – Network Event Management & Alerting
</p>
```

7. version-sprawl.component.ts

```
html

<!-- BEFORE -->
<p class="source-note">Source: <strong>Intune</strong> – Software Inventory</p>

<!-- AFTER -->
<p class="source-note">
  Source: <strong>DataNX</strong> – Network Device & Port Inventory
</p>
```

8. data-sources.component.ts

```
html

<!-- BEFORE -->
<p class="source-note">All ingestion pipelines status</p>

<!-- AFTER -->
<p class="source-note">
  Ingestion status for all 6 sources:
  <strong>NETCOOL</strong> · <strong>DXNETOPS</strong> ·
  <strong>ElastiFlow</strong> · <strong>Netscout App</strong> ·
  <strong>Netscout Throughput</strong> · <strong>DataNX</strong>
</p>
```

9. Empty State Message (add to all components)

Since data filters by `snapshot_date = current_date()`, add a helpful empty state message so developers know what to do when data is stale:

```
html
```

```
<div *ngIf="!loading && data.length === 0" class="empty-state">
  <mat-icon>info_outline</mat-icon>
  <p>No data for today. Run the ingestion pipeline:</p>
  <code>python scripts/generate_mock_logs.py --days 1 && python run_pipeline
</div>
```

What Does NOT Need to Change

- API service URLs (`/api/app-health`, `/api/device-health`, etc.) — unchanged
- TypeScript model interfaces — column names in gold tables are unchanged
- Routing (`app.routes.ts`) — unchanged
- Chart/table logic — unchanged
- CSS/styles — unchanged

The gold table column names stayed the same when we switched from synthetic to real source schemas. Only the human-readable labels in templates need updating.
